Long-acting reversible contraception

About half of all births in Maryland are unintended. The American Congress of Obstetrics and Gynecology recommends that long-acting reversible contraception (LARC) methods, such as intrauterine devices and contraceptive implants, be offered as first-line contraceptive methods. This recommendation is based upon the fact that LARC devices are safe and highly beneficial when inserted immediately postpartum.

Amerigroup Community Care is committed to enhancing access to women's health services and improving birth outcomes by providing access to LARC in the form of intrauterine devices (IUDs) and etonogestrel implants.

How this benefit works

During an inpatient facility admission, you will have the ability to implant the device of your patient's choice and receive the same reimbursement as if the device were implanted on an outpatient basis. The inpatient facility will provide the device. Please work closely with your obstetrical unit to understand the logistics of obtaining the devices.

What to do before providing this benefit to your patients

We respectfully ask you to discuss the option for immediate postpartum placement of LARC with your patients early on during the third trimester of pregnancy. Please provide additional counseling and support to your teenage and young patients (ages 13-19) as this group is at the greatest risk for early discontinuation of these methods.[1] It appears that there is lower discontinuation at two years of IUDs as compared to the etonogestrel implant.[2] When clinically appropriate, IUDs should be considered over the implant.

Advantages of LARC

Unintended pregnancies are associated with higher rates of maternal and neonatal complications of pregnancy and continue to be a concerning health problem in the United States.[3] Long-acting methods are more effective at preventing unintended pregnancies and have significantly greater continuation rates than oral contraceptives, the vaginal contraceptive ring or the contraceptive patch. These methods also have very low rates of serious side effects.[4]

Frequently Asked Questions

When should the intrauterine device (IUD) or Nexplanon be inserted postpartum?
The IUD can be inserted in the postpartum period:

- Within 10 minutes after the delivery of the placenta.
- Up to 48 hours after delivery.
- At the time of Cesarean delivery.
- At any point following delivery.

What are instances when postpartum IUD placement should be avoided?
Immediate postplacenta insertion should be avoided in patients with a fever. Patients with rupture of membranes greater than 36 hours before delivery, a postpartum hemorrhage or extensive genital lacerations should be referred for interval insertion.

Where can I find additional information regarding postpartum long-acting reversible contraception (LARC)?
Additional information can be found at www.acog.org. Information may also be found at www.arhp.org.

What are the CPT codes associated with IUD and Nexplanon insertion in the hospital setting?
The CPT and associated ICD-10 codes are unchanged for the hospital setting. Use
11981 – insertion, nonbiodegradable drug delivery implant; 58300 – insertion of IUD.

Does placement of an IUD in the postpartum period increase a woman's chance of infertility in the future?
No, there is no data to suggest that there is any adverse effect on future fertility. Baseline fecundity has been shown to return rapidly after IUD removal.[5]

Is there a greater rate of IUD expulsion with postpartum placement of an IUD?
Yes, the actual expulsion rate varies with device type. An important study of the Copper T 380A by Celen et al demonstrated expulsion rates at six weeks, six months and 12 months of 5.1 percent, 7 percent and 12.3 percent,[6] respectively. A study of expulsion rates of the levonorgestrel-containing system demonstrated an expulsion rate of 10 percent at 10 weeks.[7]

When should patients be seen in follow-up?
Patients should be seen between 21 days and six weeks. Many patients resume intercourse before the six-week checkup. To prevent unintended pregnancies, it is important to confirm that the device is still in place.
